

WinSplit

v. 1.0

(c) 2008 by Bodo L. van Laak

1. System Requirements

This software is tested on Windows XP. It may run on Vista, but it was not tested. You need .NET 3.5 framework for running this software. You can download and install it from the following address:

[download .NET 3.5 framework](#)

2. Installation of the software

This piece of software does not need any installation. Just read the license agreement, copy the files to any directory and execute it.

3. Using the software

First select a file to be splittet.

Second select the one of the following split options:

- split the file into a discrete number of parts of nearly the same size
- split the files in a way that the resulting files are maximum x kB/MB in size
- split the files into CD-Size (you can choose different CD formats)
- split the files into floppy-disc size (1440kb).

Third push on the "Split" button and wait until the message "finished splitting" appears.

The result of the maneuver is saved under the original files directory in a subdirectory with the same name as the file without extension.

Example:

Splitting a file

```
c:\myoriginalfile.exe
```

into 5 parts will result in following files:

```
c:\myoriginalfile\1  
c:\myoriginalfile\2  
c:\myoriginalfile\3  
c:\myoriginalfile\4  
c:\myoriginalfile\5
```

4. Merging the splitfiles again

You need no additional software to merge the splitfiles again. Simply open a dosbox and do a binary copy. E.g. I split myoriginalfile.exe into 5 files. I can merge them again with the following command:

```
copy /b 1 + 2 + 3 + 4 + 5 myoriginalfile.exe
```

in the directory c:\myoriginalfile\.

4. License and warranty

Bodo L. van Laak hereby grants you the right to install and use an unlimited number of copies of the "WinSplit v1.0" software and its components.

LICENSE LIMITATIONS

This software is provided free of charge. It must not be used for commercial purposes, for example:

- Selling, licensing or renting the software to third parties for fee, wether direct or indirect
